Project Overview

A data management tool that stores and tracks plant collection details through a complete workflow.

- helps users decide which individual plants to collect

- be a two way sync point for a current plant collection mobile app

- track the collection process

- help users decide which collections go for dna sequencing

- track the dna sequencing process

- works through a web browser, accessible on all devices

This is essential infrastructure for getting species collected and analysed. It will streamline processes, reduce error and enable better transition of an internal database to the web.
